

- Maybe we should add username and password variable in Instructor and Student class. And we use `from django.contrib.auth.models import User`, and when we create a new student or instructor, call `user = models.ForeignKey(User, on_delete=models.CASCADE)`, so that it can be added as a user. And we should configure the permission group to make sure the student and instructor can visit the page we want.
- In `urls.py`, nothing need to be changed, because this method does not need to create anymore view.
- In `views.py`, nothing need to be changed.
- In `forms.py` we need to add `clean_username` and `clean_password` function.
- No change for templates because we only need to change the thing in forms.

Tips: I am not sure if this method will work, but it is the best solution I have for now. I am really curious about the solution made by the teacher.
